

Neo Bio[®]

Stops pollution in island resort

Success story, September 2009

July 10th, black water, bubbling with gas

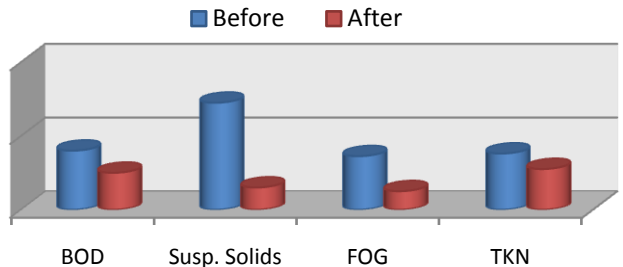

Sept. 17th, water is clear, pollution and nuisances are stopped.

Thailand: a high-end island resort leverages NeoBio Septic's swift action to depollute black water in worker camps.

The resort was looking for a convenient, eco-friendly solution to stop the pollution generated during the final stages of its construction. NeoBio Septic was chosen to treat the toilets and the small 2 CBM septic tanks recently installed at the worker camps. One sachet was to be dropped directly into each toilet, every two weeks.

After the first treatment, smell went down to an unnoticeable level as NeoBio's microorganisms quickly started to digest organic waste in piping and septic tanks.

After one week the stream, into which the wastewater was being releasing directly, stopped bubbling with gases. Two months later the wastewater is totally depolluted and nuisances are a thing of the past.

The treatment: one 25 gram sachet of NeoBio Septic is dropped directly into each bowl, every 2 weeks. It is harmless to humans, animals, fish and plants.
